Analysing where-questions and human-generated answers

Research Problem

“the answering of questions is not a simple retrieval and response of stored information; rather the process is embedded in a general structural framework containing knowledge of the questioner, the question, and the world around it”

Don Norman

Research Objectives

In generating relevant responses to where-questions, two factors are important:

• Content of questions (what is asked?)
• Context of conversations (e.g., who has asked?)

Here, the focus is on the relation between the content of where-questions and their human-generated answers

Distribution of place types in the questions and answers

Distribution of prominence in the questions and answers

Distribution of scale in the questions and answers
